

Prizm Energy QC Report 26024

QC Report — Payment Request App Link and Native Detail Recovery

Report Header

Field	Value
Report Code	PE-QAQC-QC-RPT-26024-R01
Session ID	payment-request-app-link-detail-20260802
Date / Time	2026-08-02 16:22 +04:00
Agent / Model	Codex / GPT-5
Backend workspace	C:/wamp64/www/prizm331-wt-mobile-parity-next
Mobile workspace	C:/wamp64/www/prizm-mobile-app-link-fix
Backend branch	feat/mobile-native-parity-next-DESKTOP-9GO5QC0
Mobile branch	codex/full-native-parity-audit
Turns	Continuous parity task chain
Classification	Internal

1. Executive Summary

The reported URL `https://ms.prizm-energy.com/MS/przpurchase/Payment_Request/view_payment_request/1211` was traced across the production association file, Android package resolver, browser bridge, native route resolver, mobile approval query, canonical Perfix Payment Request controller/model, and the production database.

Android domain verification is healthy: the production `assetlinks.json` returns HTTP 200, its SHA-256 certificate fingerprint matches the installed application signature, the domain is verified, supported-link handling is enabled, and Android resolves the exact URL to `com.prizmenenergy.mobile/.MainActivity`. The HTTPS handoff reached the native Payment Request screen in the emulator.

That test exposed a separate S1 data defect. Production record 1211 exists, but `Przpayment_model::get_payment_detail()` joined a nonexistent unprefixd `suppliers` table. The real table is `tblsuppliers`; the failed model query made the mobile API return `Payment Request not found`, while the web UI continued to work through a different read path. The join now uses `db_prefix() . 'suppliers'`, and the corrected production read-only SQL returns record 1211.

The browser bridge was also hardened for phones or embedded browsers that bypass verified HTTPS links. It now addresses the installed `prizmcrm` application scheme, carries the complete original ERP URL in a validated payload, retains the browser fallback, and rejects external targets. Before the change, the same scheme URL produced Expo’s Unmatched Route screen; after the change, it opened the native Payment Request route.

The scoped candidate passes. Deployment remains held for the requested single consolidated Android release, so the production API and the currently installed phone APK do not yet contain this checkpoint.

2. Test Results

Check	Evidence	Result
Production association	<code>/.well-known/assetlinks.json</code>	HTTP 200; package and fingerprint match
Android domain state	<code>pm get-app-links</code>	<code>ms.prizm-energy.com:</code> verified ; link handling enabled
Exact HTTPS resolver	Android package query	Prizm MainActivity advertised for record 1211 URL
Exact HTTPS launch	Android activity manager	PASS — native Payment Request route opened
Production browser bridge	Android document request	HTTP 200; bridge and package intent present
Web MVC source	Payment_Request controller and Przpayment_model	REVIEWED
Production record	<code>tblprz_payment_request.id = 1211</code>	EXISTS
Production schema	<code>suppliers / tblsuppliers</code>	0 / 1 tables
Broken model join	unprefixed supplier join	Reproduced: table does not exist
Corrected model join	prefixed supplier join	PASS — record 1211 returned
Scheme routing before fix	<code>prizmcrm:///MS/.../1211</code>	Reproduced: Unmatched Route
Scheme routing after fix	<code>prizmcrm://open?url=...1211</code>	PASS — native Payment Request route
External-target fence	custom scheme carrying example.com	PASS — falls back to native ERP hub
TypeScript	<code>npm tsc --noEmit -p tsconfig.json</code>	PASS
Mobile contracts	<code>node scripts/test-mobile-contracts.mjs</code>	PASS
Backend syntax	PHP lint	PASS
Browser bridge contract	<code>mobile_app_link_bridge_contract_test.php</code>	PASS — 11/11
Payment detail contract	<code>payment_request_detail_contract_test.php</code>	PASS — 4/4
Workspace safety	git status	PASS — user-owned <code>artifacts/</code> untouched

3. Acceptance Criteria

Severity	Criterion	Result
S1	Exact Payment Request URL reaches the native module	100% PASS in candidate emulator
S1	Native detail query uses the canonical supplier table	100% PASS in source, contract, and production read-only SQL

Severity	Criterion	Result
S1	External URLs cannot be smuggled through the custom scheme	100% PASS
S2	Browser/WebView bypass has an explicit installed-app fallback	100% PASS in candidate
S2	Browser fallback preserves the complete path and query	100% PASS
Release	Corrected API and app behavior are visible on the physical phone	PENDING consolidated deployment

Scoped quality gate: PASS. Deployment gate: HELD for one consolidated APK. Overall parity programme: OPEN.

4. Code Changes

Backend

- `modules/przpurchase/models/Przpayment_model.php`
- `modules/api/helpers/mobile_app_link_helper.php`
- `modules/api/tests/mobile_app_link_bridge_contract_test.php`
- `modules/api/tests/payment_request_detail_contract_test.php`
- Commit `0ef48f2f3` — `fix(api): resolve payment request mobile links`

Mobile

- `lib/native-routing.ts`
- `scripts/test-mobile-contracts.mjs`
- Commit `f980d65` — `fix: harden browser deep-link fallback`

The document-generation skill was used only to produce and visually verify this mandatory QC artifact; it did not influence application behavior.

5. Deployment Status

Target	Status
Backend production	NOT DEPLOYED — production still has the broken unprefixd detail join
Mobile GitHub/main	NOT PUSHED
Android APK	NOT BUILT — preserving the requested single final build
Release metadata	v1.17.0 / versionCode 35 unchanged
Existing phone	Still runs the previously published behavior until consolidated update

6. Evidence and Residual Risk

- HTTPS App Link evidence: C:/wamp64/tmp/payment-request-app-link-1211.png .
- Custom-scheme evidence: C:/wamp64/tmp/payment-scheme-fixed-1211.png .
- The screenshots still show Payment Request not found because the corrected backend commit is intentionally not deployed yet; routing itself is proven by reaching the correct native module.
- Chrome and some OEM browsers intentionally suppress automatic external-app launches without a user gesture. The verified HTTPS route remains primary; the bridge's orange action now uses the installed app scheme as the deterministic fallback.
- Physical-phone verification is mandatory after the final backend deployment and consolidated APK installation.
- User-owned artifacts/ remains untouched.

7. Sign-Off

Role	Status
Engineering / Codex	Scoped implementation and verification complete
QA/QC	PASS for candidate App Link handoff and Payment Request detail recovery
Product owner	Final acceptance pending consolidated release
